Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Xgapop 10.0 , Xgapext

It comprises nucleotides 868-2631 of the full-length Bst polymerase coding sequence, and was obtd. by PCR cloning (see also AAT60826-27) using Bst genomic DNA as template. The DNA construct can be used to produce recombinant Bst polymerase large fragment, pref. as a fusion protein with maltose binding protein, in transformed host cells. The product can be used for nucleic acid sequencing and strand displacement amplification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This is the nucleotide sequence of the clone Bst2 encoding a modified Bacillus stearothermophilus thermostable DNA polymerase which lacks the complete 5'-3' exonuclease domain. The gene was constructed by liquting the HindIII-SalI tragment from the clone peemBst2.1Sst. contq. 3' end of the gene with the Sty1-HindIII fragment of the clone peemBst5'end contg. the 5' end of the DNA polymerase gene. The Sty1-HindIII fragment covers the mid-region of the gene up to and including the sequences encoding the 3'-5' exonuclease but not the 5'-3' exonuclease domain. The remainder of the 5' end of the gene was reconstituted by the ligated and extended oligonucleotides AATO4816-17. The modified DNA polymerase can be used in primer extension reactions such as DNA sequencing or polymerase chain reaction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Best Local Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Alignment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  polymerase. This heat stable DNA polymerase has a peptide sequence of 587 amino acids. This DNA polymerase can be used in a method for the replication of a DNA chain. It can also be used in a method for the determination of the sequence of DNA chain. As the DNA polymerase has a proof reading 3'-5' exonuclease activity, possible mismatches of base pairing that occurs in current methods of DNA sequence determination of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   triphosphates (ddNTP), or their analogs, and reduces the discrimination, observed with the unmodified enzyme, for incorporation of labeled ddCTP and ddATP, is new. The modified DNA polymerase, has proofreading 3'-5' exonuclease activity during DNA sequencing from a template and the polymerase excises mismatched nucleotides from the 3' terminus at a faster rate than it removes correctly matched nucleotides. The polymerase is used particularly for DNA sequencing, also for filling in
                                                                                                                                                                                                                                                                                                                          New DNA polymerase, useful

The present sequence encodes a wild type Bacillus Stearothermophilus DNA polymerase (AAY91931) that is modified (see AAY91930) so that during DNA sequencing, it effectively incorporates all four fluorescent dye-labeled dideoxynucleotide triphosphates (ddNTP), or their analogs, and reduces the discrimination, observed with the unmodified enzyme, for incorporation of labeled ddCTP and ddATP, is new. The modified DNA polymerase, has proofreading 3'-5' exonuclease activity during DNA

Example 2; Page 80-82; 109pp; English

The invention relates to reverse transcription of RNA templates using thermostable DNA polymerase such as Thermoactinomyces vulgaris (Tvu) and Bacillus stearothermophilus (Bst) DNA polymerase. Tvu and Bst DNA polymerase are useful for reverse transcription reactions which allows repetitive heating/cooling cycles without the requirement of fresh enzyme at each cooling step. The invention contemplates single-reaction RT-PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Local Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1294 TTGGCGCAAAACTTGAACATTACGCGCAAAGAA 1326
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequencing from a template and the polymerase excises mismatched nucleotides from the 3' terminus at a faster rate than it removes correctly matched nucleotides. The polymerase is used particularly DNA sequencing, also for filling in 5' overhangs, synthesis of DNA
                                                                                                                                                                                                                                                                                                                         Reverse transcription of RNA using Tvu and Bst DNA polymerase, comprises combining the polymerase, RNA containing sample, a primer and reaction buffer having magnesium ions and reacting the mixture to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pred
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Alignment Scores:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           wherein reverse transcription and amplification are performed in a single continuous procedure. Primers, template, nucleoside triphosphates, appropriate reaction buffer having magnesium ions, reaction conditions, and polymerase are used in the PCR process, which involves denaturation of target DNA, hybridisation of primers and synthesis of complementary
                          This is the nucleotide sequence of the clone Bst3 encoding a modified Bacillus stearothermophilus thermostable DNA polymerase which contains a deletion in the 5'-3' exonuclease domain. The gene was constructed by digestion and recombination of the full length gene (AAF04801) to remove a 195 bp HinciI-PvulI fragment from the region encoding the 5'-3' exonuclease. The deleted fragment removes 65 amino acids (residues 178-242 of the protein) including 2 Gly residues though to correspond to 2 amino acids in the E.coli DNA polymerase I necessary for 5'-3' exonuclease activity. The modified DNA polymerase can be used in primer exonuclease activity. The modified DNA polymerase can be used in primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1294 TTGGCGCANAACTTGAACATTACGCGCAAAGAA 1326

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Alignment Scores:
             The invention relates to reverse transcription of RNA templates using thermostable DNA polymerase such as Thermoacthomyces vulgaris (Tvu) and Bacillus stearothermophilus (Bst) DNA polymerase Tvu and Bst DNA polymerase are useful for reverse transcription reactions which allows repetitive heating/cooling cycles without the requirement of fresh enzyme at each cooling step. The invention contemplates single-reaction RT-PCR wherein reverse transcription and amplification are performed in a single continuous procedure. Primers, template, nucleoside triphosphates, appropriate reaction buffer having magnesium ions, reaction conditions, and polymerase are used in the PCR process, which involves denaturation
                                                                                                                                                                                                                                                                                                                    Reverse transcription of RNA using Tvu and Bst DNA polymerase, comprises combining the polymerase, RNA containing sample, a primer reaction buffer having magnesium ions and reacting the mixture to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Percent Similarity:
having DNA synthesis activity. It is useful for determining the nucleotide base sequence of a DNA molecule. Twu DNA polymerase can be used for processes of high temperature nucleic acid amplification and sequencing without substantial loss of DNA synthesis activity. The enzean be used to perform high temperature reverse transcription in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of target DNA, hybridisation of primers and synthesis of complementary strands. The present sequence is Thermoactinomyces vulgaris (Tvu) DNA polymerase 7289M truncated mutant DNA. This Tvu T289M mutant DNA is obtained by deleting 864 bases from the 5' end of wild-type Tvu DNA polymerase gone and replacing 'C' at position 866 with 'T' in the wild
                                                                                                          The invention provides compositions comprising thermostable DNA polymerases derived from hyperthermophilic eubacteria, in particular, polymerases derived from hyperthermophilic eubacteria, in particular, polymerases purified and isolated Thermoactinomyces vulgaris (Tvu) DNA polymerase
                                                                                                                                                                                                     Claim 17; Fig 7; 113pp; English
                                                                                                                                                                                                                                           Novel thermostable DNA polymerase derived from Thermoactinomyces vulgaris for us in many recombinant DNA techniques, including amplification, reverse transcription and sequencing reactions -
                                                                                                                                                                                                                                                                                                                                          P-PSDB;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Alignment Scores:
This DNA sequence of the Bacillus stearothermophilus strain encodes a heat stable DNA polymerase. This DNA polymerase has a peptide sequence of 589 amino acids. This DNA polymerase can be used in a method for the replication of a DNA chain. It can also be used in a method for the determination of the sequence of DNA chain. As the DNA polymerase has a

Using the Tvu DNA polymerase, reverse transcription reactions can be conducted at increased temperatures so that secondary structure is removed or limited. The present sequence represents the nucleotide sequence encoding a 5′-3′ exonuclease deletion mutant form of Tvu DNA polymerase called T289M.
                                                                                  Claim 13; Pages 27-28; 32pp;
                                                                                                                                                                                WPI; 1997-474304/44
                                                                                                                                                                                                                                                                                                                                                                                                     JP09220087-A

                             This is the nucleotide sequence of the clone Bst4 encoding a modified Bacillus stearothermophilus thermostable DNA polymerase. This clone encodes the sequence of a natural degradation product obtained when the DNA polymerase clone Bst3 (AAT04803) is expressed in E.coli. The same sequence is found when the full length clone (AAT04801) is expressed and cleaved with subtilisin to produce a "Klenow-type" DNA polymerase. This sequence starts with the Val residue at pos. 287 of the full length protein. This contrasts with a commercially available B stearothermophilus DNA polymerase subtilisin fragment where the protein sequence starts with the Ala residue corresp. to pos. 290. The modified DNA polymerase can be used in primer extension reactions such a NA segment of the contrasts with the Ala residue corresp.

                                                         A gene coding for DNA polymerase I was isolated from B.caldotenax YT-G genomic DNA (see AAQ31650). A series of N-terminal deletions was prepared to eliminate the region responsible for 5′ to 3′ exonuclease activity. Plasmid pUI205 was one of the deletion plasmids which still expressed Poll activity but for which no 5′ to 3′ exonuclease activity was detected. The insert contained in pUI205 is identical to nucleotides 1090 to 2868 of AAQ31650. E.coli HB101 transformed with pUI205 produced a heat-resistant DNA polymerase of mol. wt. 67,000 by SDS-PAGE.

The invention relates to reverse transcription of RNA templates using thermostable DNA polymerase such as Thermoactinomyces vulgaris (Tvu) and Bat DNA polymerase. Tvu and Bat DNA CC polymerase are useful for reverse transcription reactions which allows CC repetitive healing/cooling cycles without the requirement of fresh enzyme CC repetitive healing/cooling cycles without the requirement of fresh enzyme CC wherein reverse transcription and amplification are performed in a single CC continuous procedure. Primers, template, nucleoside triphosphates, CC appropriate reaction buffer having magnesium inons, reaction conditions, CC and polymerase are used in the PCR process, which involves denaturation CC of target DNA, hybridisation of primers and synthesis of complementary CC strands. The present sequence is Thermoactinomyces vulgaris (Tvu) DNA CC polymerase M285 truncated mutant DNA. This Tvu M285 mutant DNA is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Alignment Scores:
                                                                                       The invention provides compositions comprising thermostable DNA polymerases derived from hyperthermophilic cubacteria, in particular, a purified and isolated Thermoactinomyces vulgaris (Tvu) DNA polymerase having DNA synthesis activity. It is useful for determining the nucleotide base sequence of a DNA molecule. Tvu DNA polymerase can be used for processes of high temperature nucleic acid amplification and sequencing without substantial loss of DNA synthesis activity. The enzyme can be used to perform high temperature reverse transcription in the absence of manganese ions and in high throughput robotically manipulated
                               procedures because greater enzymatic stability is retained at room temperature. Using the Tvu DNA polymerase, reverse transcription reactions can be conducted at increased temperatures so that secondary structure is removed or limited. The present sequence represents the
nucleotide sequence encoding a 5'-3' Tvu DNA polymerase called M285.

                        This is the sequence of the coding region of the gene encoding the Bacillus stearothermophilus thermostable DNA polymerase. The gene was isolated using the PCR primers and probes AAT04807-15 which were based on sequence similarity with the Bacillus caldotenax DNA polymerase gene. The gene was isolated as two overlapping fragments of 885 and 1143 bp corresp. to the 3' end and the 3'-5' exonuclease region of the protein, resp. Those amplification fragments were used to probe Southern gels and isolate the 3' and 5' ends of the gene as two separate iragments. The complete gene (AAT04801) was subsequently polymerase can be used in primer extension reactions such as DNA sequencing or polymerase chain reaction.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                  Score

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
